Profile

Software engineer with nearly two years in high-growth Fintech and Proptech. Track record of cutting operational wait times by up to **90%**, defending production under live attack, and bridging backend systems (Python, Go, Ruby) with CRM ecosystems (Salesforce). Fluent across English and Spanish with Legal, Commercial and Operations.

Business Capabilities

Stakeholder Management
Turn Legal, Commercial and Operations needs into engineering that ships.

Cross-functional Leadership
Bridge engineering, product and business so decisions land, not stall.

Technical Ownership
End-to-end ownership of core engines, architecture through post-incident review.

Incident Response
Calm, visible post-mortems — people see what happened and what changed.

Technical Toolbox

Languages	Python, Go, Ruby, TypeScript, Solidity, JavaScript, SQL
Integrations	Salesforce, Slack, RabbitMQ, REST APIs, custom AWS & Slack wrappers
Databases	PostgreSQL, MySQL
DevOps & Cloud	AWS, GCP, Docker, CI/CD, GitHub Actions
Practices	SRE principles, security architecture, system design, code review
Languages spoken	English (C1) · Spanish (Native)

Experience

Aug 2024 – Present

Software Engineer — SRE & Core Logic Lead, *Duppla*, Bogotá, Colombia, *Technical ownership · Cross-functional lead*

I own the core business engines and the reliability practice, acting as a translator between engineering and the commercial, legal and operations teams.

- **Core Product Ownership (–83%)** *[Commercial · Operations]*
  Partnered with Operations and Commercial to redesign the Real Estate Evaluator. A 90-minute wait collapsed to 15 — the 83% returned most of an afternoon to analysts talking to clients instead of refreshing a screen.
- **Live Attack Defense (100% repelled)** *[Engineering · Leadership]*
  A bot slipped in a crafted request that exposed the full API surface; attacks on billing and reporting endpoints followed within minutes. I caught the attack live through the observability I had designed, shipped defenses on the targeted endpoints in real time, and hardened the backend into a posture that has repelled every subsequent attempt.
- **Contract Automation** *[Legal · Product]*
  Leading a contract generation engine co-designed with Legal, unblocking deal flow during Series A preparation.
- **Salesforce Integration** *[Commercial · RevOps]*
  Bridge engineer between backend services and the commercial platform, giving the revenue team a CRM source of truth.
- **Developer Experience (–30%)** *[Engineering]*
  Custom AWS and Slack wrappers that standardised tooling and removed 30% of technical debt — new engineers ship on day one instead of deciphering.

Jun 2024 – Aug 2024

Software Development Intern, *Duppla*, Bogotá, Colombia, *First production ownership*

Took the early leap from academic code into production work: backend services for customer assessment and internal logistics on Slack.

- **Business Process Migration (–90%)** *[Legal · Risk · Origination]*
  Rebuilt the Client Evaluator backend in conversation with Legal, Risk and Origination. Thirty minutes of manual work collapsed into three — 90% of queue time returned to the people who actually weigh the hard cases.
- **Internal Logistics** *[People Ops]*
  Slack automation for attendance and office logistics still used daily by HQ.
- **Stability** *[IT]*
  Credentialing code running with minimal maintenance two years post-launch — the quiet kind of reliability.

Education

2020 – 2027 (Expected)

B.S. Systems & Computing Engineering, *Universidad de los Andes*, Bogotá, Colombia

Relevant coursework: Software Architecture, Distributed Systems, Cybersecurity, Databases, Cloud Computing.

Notable Engineering Projects

Real Estate Evaluation Engine — -83% processing time

[Commercial · Operations]

Human problem. Commercial analysts waited 90 minutes per property evaluation — long enough for a client to cool off and a negotiation to stall.

Technical answer. Migrated the engine out of Retool into a custom intranet, tightened pricing logic and automated upstream data flows so analysts see a result in 15 minutes.

Business Client Evaluator — -90% cycle time

[Commercial · Origination]

Human problem. Origination sat on every prospect for 30 minutes of manual screening — good leads went cold in the queue while unfit ones ate the same half-hour before they could be discarded.

Technical answer. Full backend rewrite: new data model, leaner queries and asynchronous scoring. Evaluation cycle dropped from 30 minutes to 3, letting the team act on signal instead of grinding through noise.

Contract Automation Engine

[Legal · Product]

Human problem. Every contract was hand-crafted from manual templates riddled with typo-prone patterns and incomplete variable slots. The team burned hours per deal, lost traceability between versions, and shipped errors that slipped past review.

Technical answer. Rebuilt the templates from scratch to remove error-prone variable patterns, then wired a generation-and-review pipeline that pulls each business opportunity's data automatically — every contract is now versioned, validated, and auditable end-to-end.

Live Attack Defense — 100% repelled

[Engineering · Leadership]

Human problem. A bot slipped in a crafted request that revealed our full API surface; within minutes, attacks flooded the billing and reporting endpoints — the kind of hit that moves real money.

Technical answer. Caught the attack live through the observability I had designed, shipped endpoint-level defenses on the targeted routes before they could execute, and hardened the backend into a posture that has repelled every subsequent attempt as attack volume has grown.
