EXPERIENCE

Junior Software Engineer — core logic & production ownership
Duppla Bogotá, Colombia | Aug 2024 – Present

Translator between engineering and the commercial, legal and operations teams — and the engineer who then builds what the conversation agreed on.

- **Core Product Ownership (–96%)** *[Commercial · Operations]*
  Rebuilt the Real Estate Evaluator over four iterations: backend automation, a human-in-the-loop review layer, a migration off Retool once low-code became the constraint rather than the shortcut, then an end-to-end pass over back and front.

  Analyst time per property went 90 minutes to 15 to 10 to 4. It sustains 1,100 evaluations a day; of the 3 minutes a run takes, 90 seconds is the data provider, not our code.
- **Live Attack Defense (caught in minutes)** *[Engineering · Leadership]*
  Months earlier I had added a deliberately small detector: HTTP exceptions carrying known attack signatures, and sources accumulating failed requests.

  When a bot exposed the full API surface and attacks hit billing and reporting within minutes, that cheap signal caught it live. Shipped endpoint-level defenses in real time and hardened the backend; no successful intrusion recorded since, as volume has grown.
- **Contract Automation (–90% review errors)** *[Legal · Commercial · Operations]*
  Sole designer and owner of the contract generation engine — unowned work I made the case for — now the company's only contract path. Modelled the legal document as validated data, not a text template: typed placeholders and validation rules refuse an incomplete contract before it reaches a lawyer.

  Review errors down 90%, request-to-approval turnaround down 40%. Load-tested at fifteen times daily volume in an hour; the ceiling was the provider's rate limit, not the pipeline — the hundredfold planned for is a quota change, not a rebuild.
- **Salesforce Integration (–50% CRM inconsistencies)** *[Commercial · RevOps]*
  Own the seam between the backend and Salesforce: proposed the schema and SOQL/SOSL optimisations the org now runs on.

  Built the data-cleansing and shared-utility layer that halved record inconsistencies, making CRM data reliable enough for the revenue team to report on.
- **Engineering Leverage (–30% debt growth rate)** *[Engineering]*
  Custom AWS and Slack wrappers now used across all four engineers and every backend, so nobody hand-rolls a client per service. SonarQube debt accumulation slowed about 30% against its prior trend once they landed.

  The front-end architecture I designed for contract generation became the pattern the evaluator rebuild followed; new engineers ship on day one.
- **Engineering Standards (3 → 25 generated front-ends)** *[Engineering · Leadership]*
  Raised AI-generated internal front-ends as a scoped reliability risk, not a style preference: generation outruns ownership, and the cost lands later as production surface nobody is accountable for. The estate went from three to twenty-five.

  Introduced machine-readable project context so generated code follows the

SUMMARY

Software engineer on a four-person team, owning the three engines a Fintech and Proptech business runs on — property valuation, client screening and contract generation — and how they behave in production. Cut operational wait times by up to **96%**, detected and contained a live attack on production, and bridged backend systems (Python, Go, Ruby) with CRM ecosystems (Salesforce). Building an individual-contributor career — depth in harder systems, mentoring teammates where it unblocks them. Fluent across English and Spanish with Legal, Commercial and Operations.

SKILLS

Languages
Python · Go · TypeScript · JavaScript · Ruby · SQL · Solidity

Frameworks & Front-end
Angular · Next.js · React · Vue · Astro · REST APIs

Cloud & Infrastructure
AWS · Google Cloud Platform · Northflank · Terraform · Docker · CI/CD · GitHub Actions

Databases & Data
PostgreSQL · Redis · BigQuery · SOQL/SOSL

Integrations
Salesforce (Apex, REST) · Slack · RabbitMQ · n8n

Practices
System design · Security architecture · SRE principles · Observability · Load testing · Code review · Git

EDUCATION

B.S. Systems & Computing Engineering
Universidad de los Andes
Bogotá, Colombia | Expected 2027

LANGUAGES

English **C1**
Spanish **Native**

product's own patterns instead of a generic template.

Software Development Intern

Duppla Bogotá, Colombia | Jun 2024 – Aug 2024

Took the early leap from academic code into production work: backend services for customer assessment and internal logistics on Slack.

- **Business Process Migration (–90%)** *[Legal · Risk · Origination]*
  Given one line of direction — "get this under 10 minutes" — traced the commercial call flow to find which data actually gated the decision, then rebuilt the Client Evaluator around it instead of pre-warming everything.

  Thirty minutes of manual work collapsed into three; it has since absorbed a 1,500-evaluation day against a normal load of 170.
- **Internal Logistics** *[People Ops]*
  Slack automation for attendance and office logistics still used daily by HQ.
- **Stability** *[IT]*
  Credentialing code running with minimal maintenance two years post-launch — the quiet kind of reliability.

PROJECTS

Personal portfolio & CV pipeline

Vue 3, Vite, Tailwind; GitHub Actions builds this CV from LaTeX and deploys to Pages

lob26.github.io

github.com/Lob26/Lob26.github.io

Moon Phase Background

Scheduled Python job: NASA lunar imagery, ImageMagick compositing, Windows wallpaper

github.com/Lob26/moon-phase-background-windows

Culturas Gastronómicas

Fullstack Spring Boot & Angular
